Business Problem Statement

The problem this project set out to solve

Date: 2026-11-09 Project: Banking KYC/KYB/AML Demo Design Pattern: Custom

Problem Description

A fictional US bank needs a trusted, unified view of customers and their relevant business connections to support KYC, KYB, and AML work.

> "A fictional US bank wants one trusted view of every customer."

Use Case Category

KYC (with KYB and AML screening)

Design Pattern Reference

Not applicable; no design pattern was selected.

Data Sources

1. BANK_CUSTOMERS: Customer and account records / ~120 records / people and businesses / update frequency and access not specified in the brief. 2. BUSINESS_REGISTRY: Business registry, ownership, and officer records / ~22 records / people and organizations / update frequency and access not specified in the brief. 3. AML_WATCHLIST: Sanctions, PEP, and internal fraud-list records / ~17 records / people / update frequency and access not specified in the brief.

Entity Types

Both people and organizations.

Key Matching Criteria

- Names and aliases (High priority): account for spelling variations and alternate scripts.
- Identifiers (High priority): some are partial or missing.
- Addresses and contact details (Medium priority): account for older or shared details without merging distinct people.
- Ownership and officer relationships (High priority): connect business records to owners, directors, principals, and parent companies.

Success Criteria

- Build a unified customer view while keeping similar-but-distinct people separate.
- Connect business ownership and control records to resolved customers.
- Present screening results as evidence-backed leads, then compare them with the supplied answer key and report differences.

> "Compare the results with actual_truthset_key.csv and report any differences."

Desired Output

Format: Master list; Reports Use case: One-time evaluation; operational frequency not specified Integration: Standalone

> "Each match is shown as a lead with evidence, not a verdict."

Integration Requirements

Downstream systems: None specified Integration method: Standalone Systems mentioned: None

> "No."

Deployment Target

Local / on-premises. Category: Local. Development proceeds locally first; infrastructure is a production follow-up covered by the graduation production project and migration checklist.

Timeline

Target completion: Not specified Key milestones: Complete the bootcamp workflow and compare the results with the supplied answer key.

Notes

Use the source labels described in the brief. Preserve record values and the specified attribute names; compare results with the answer key only after loading.

> "Apply the labels below. Change labels only. Keep every record value, RECORD_ID and Senzing attribute name as it is."
